                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             separately harvested after 1, 3, and 6 hours of low temperature exposure. The last 6 populations: After 7 days of growth at 20C, wheat plants were transferred to 4C in the dark. 1cm crown sections and green leaf tissu were separately harvested after 1, 3, and 6 hours of low temperature exposure. First strand synthesis in this library was done in the presence of methylated dCTP thereby protecting from internal cleavage with NotI. In addition, this library used a primer for second strand synthesis that annealed to an artificial sequence (RNA oligo) added before first strand synthesis. Therefore when sequences from EST generated from this library will be masking step will have to be included to mask this RNA oligo that is common to all clones (sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CGACTGGAGCACGAGGACACTGACATGGACTGAAGGAGTAGAAA)."

/note="Organ: Crown and leaf; Vector: pGWV.SPORT%; Aerial
parts (crown and leaf) of wheat cultivar Norstar during
dehydration stress. 8 mRNA populations were combined
before constructing the library. The first four come from
removing plants from vermiculite (7 day old plants) and
incubacing them at 20C on the bench without water for 1,
2, 3 and 4 days. The last four come from plants grown in
soil in a growth chamber after watering is terminated.
Four samplings were taken in a two week period; the first
after wilting was observed and the last, two weeks later,
consisted of live crown and stem tissue (leaf tissue was
yellow and dead). First strand synthesis in this library
was done in the presence of methylated dCTP thereby
protecting from internal cleavage with Not1."

/clone="Organ: Crown and leaf; Vector: pGWV.SPORT6; Aerial
parts (crown and leaf) of wheat cultivar Norstar during
dehydration stress. 8 mRNA populations were combined
before constructing the library. The first four come from
removing plants from vermiculite (7 day old plants) and
incubating them at 20C on the bench without water for 1,
2, 3 and 4 days. The last four come from plants grown in
soil in a growth chamber after watering is terminated.
Four samplings were taken in a two week period; the first
after wilting was observed and the last, two weeks later,
consisted of live crown and stem tissue (leaf tissue was
yellow and dead). Pirst strand synthesis in this library
was done in the presence of methylated dCTP thereby
protecting from internal cleavage with Noti."

                                                                                                                                                                                                                                with water, mystatin and cefotaxine in covered crystallization dishes. Five-day old seedling roots were then harvested, total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids. These steps were performed in the TJ Close laboratory at the University of California, Riverside (choi, Close, Fenton). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and lysis seen trimmed to remove vector sequence and sequence details on library preparation and sequence analysis see http://www.genome.clemson.edu/orders Also see Close TJ, Wing R, Kleinhofs A, Wise R (2001) Genetically and physically anachored EST resources for barley genomics.
